# Shortest paths in an edge-weighted digraph

Given an edge-weighted digraph, find the shortest path from  $s$  to  $t$ .

edge-weighted digraph

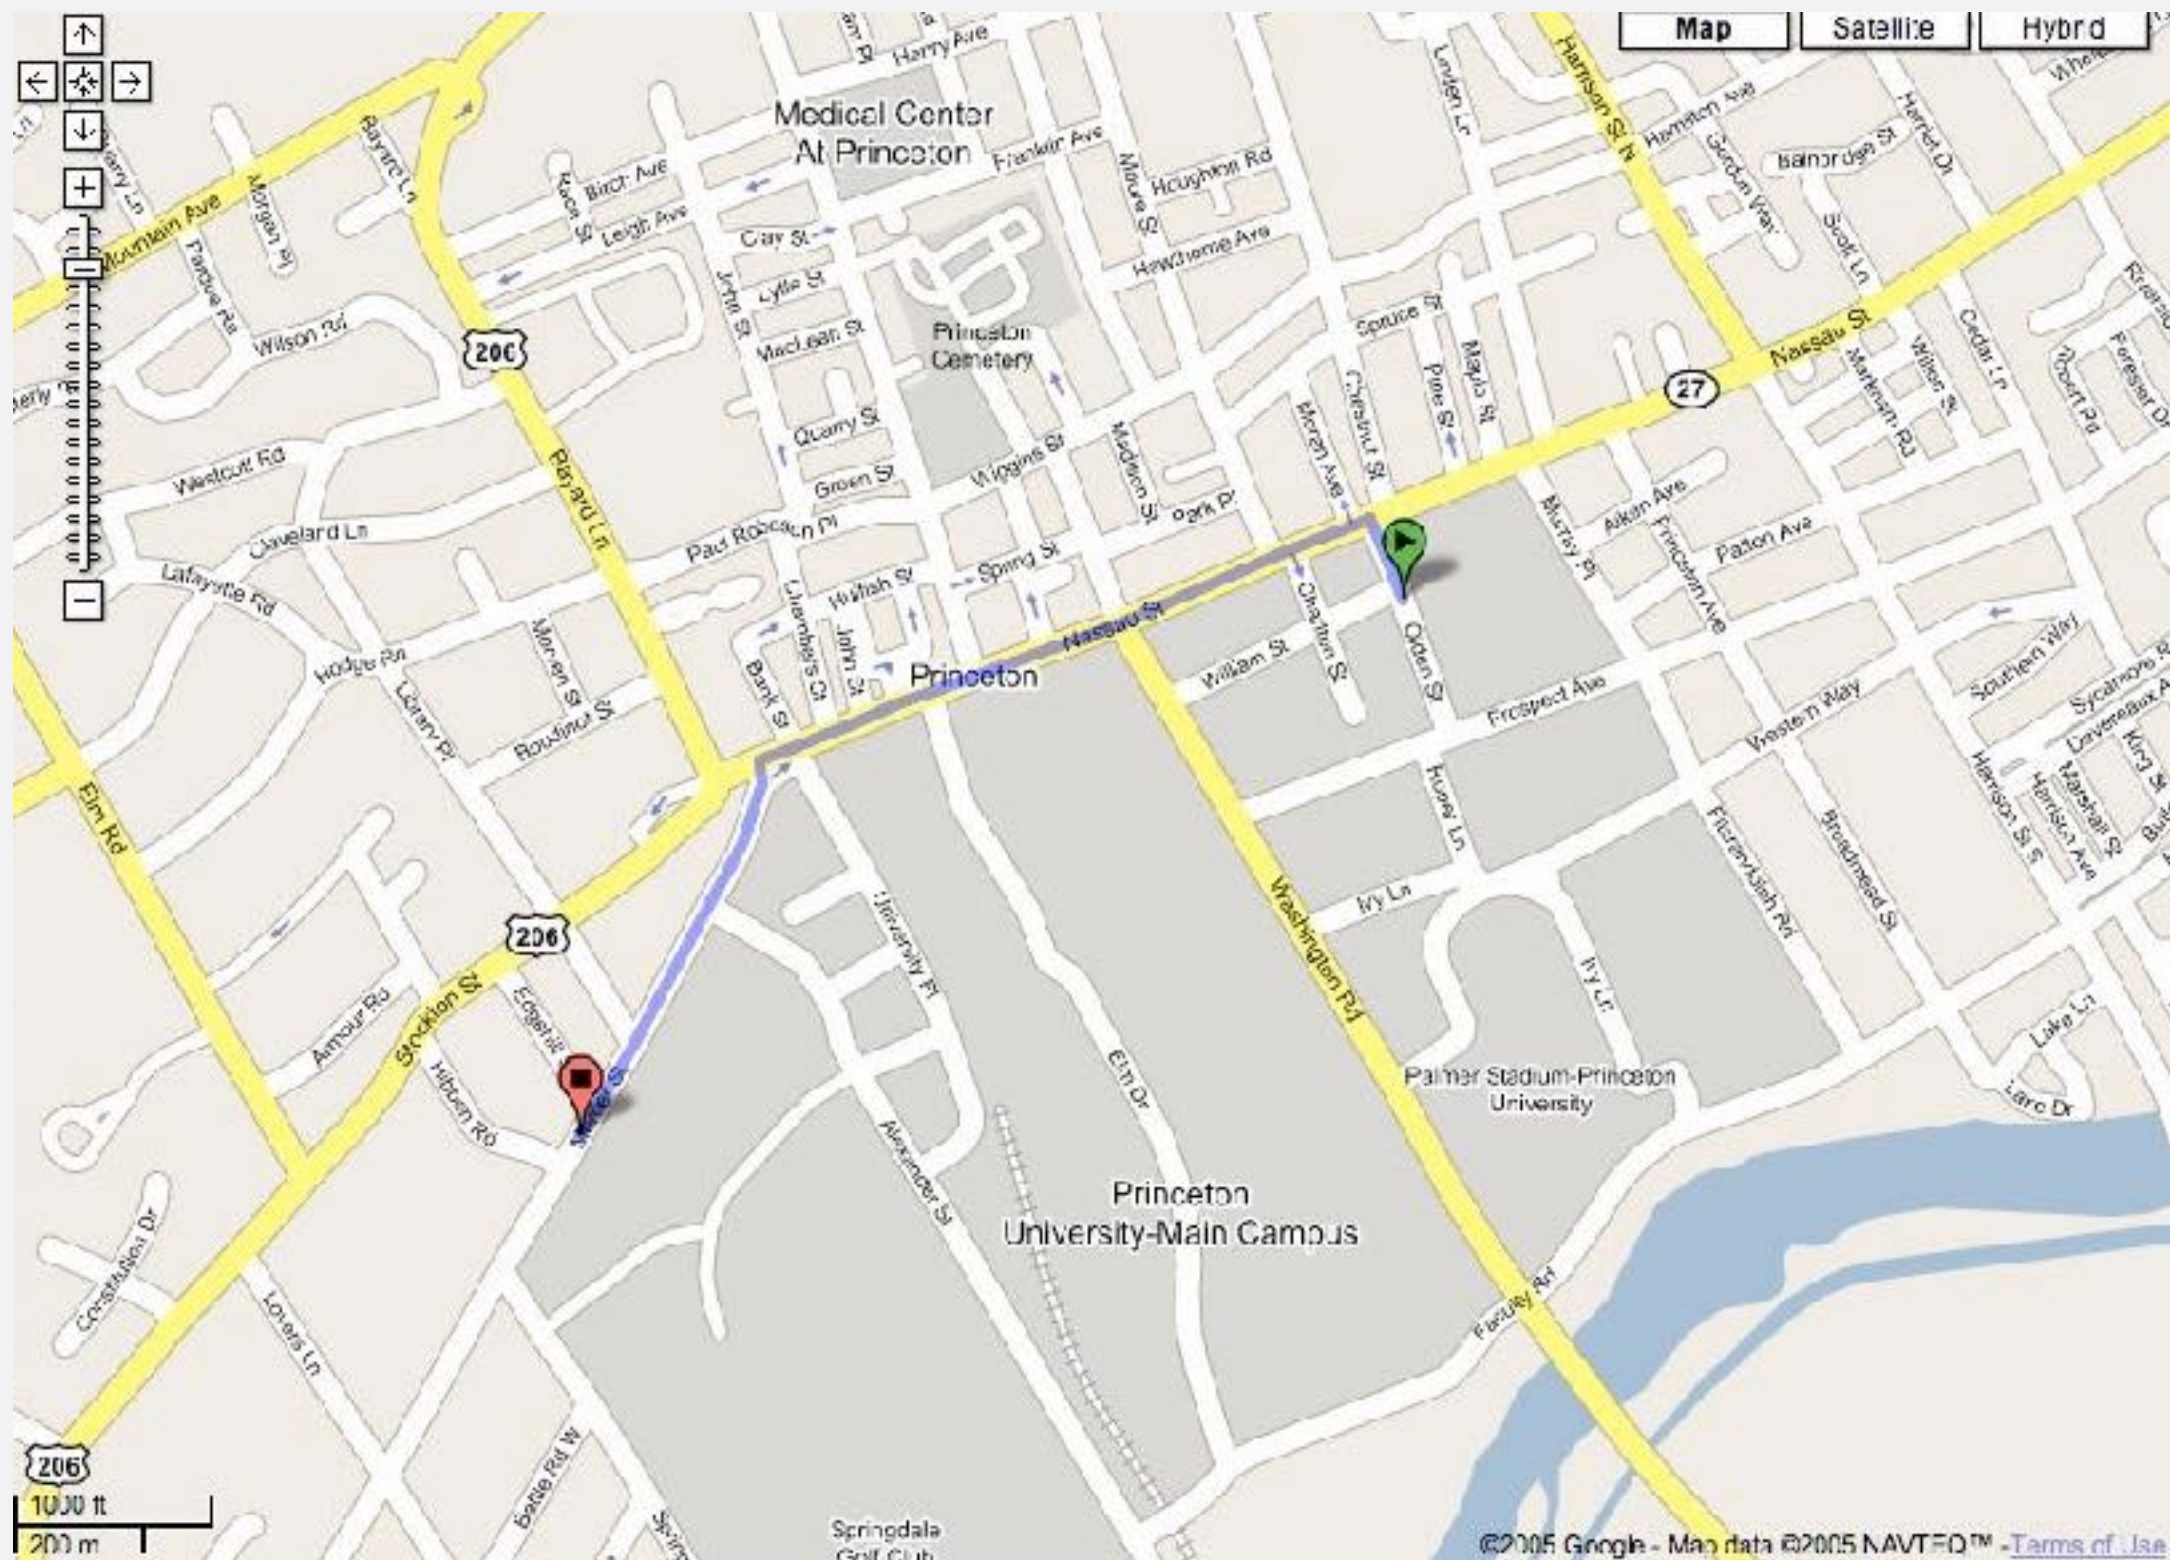

|     |      |
|-----|------|
| 4→5 | 0.35 |
| 5→4 | 0.35 |
| 4→7 | 0.37 |

| 7→3 | 0.39 |
| 3→6 | 0.52 |

# Google maps

# Shortest path variants

---

## Which vertices?

- **Single source:** from one vertex  $s$  to every other vertex.
- Source-sink: from one vertex  $s$  to another  $t$ .
- All pairs: between all pairs of vertices.

## Restrictions on edge weights?

- Nonnegative weights.
- Arbitrary weights.

## Cycles?

- No directed cycles.

which variant?

**Simplifying assumption.** Shortest paths from  $s$  to each vertex  $v$  exist.

# SHORTEST PATHS

  - ▶ *Dijkstra's algorithm*
  - ▶ *edge-weighted DAGs*
  - ▶

# Weighted directed edge API

---

```
public class DirectedEdge
```

|   |   |
|---|---|
| DirectedEdge(int v, int w, double weight) | <i>weighted edge <math>v \rightarrow w</math></i> |
| int from()                                | <i>vertex <math>v</math></i>                      |
| int to()                                  | <i>vertex <math>w</math></i>                      |
| double weight()                           | <i>weight of this edge</i>                        |
| String toString()                         | <i>string representation</i>                      |

Idiom for processing an edge  $e$ : `int v = e.from(), w = e.to();`

# Weighted directed edge: implementation in Java

---

Similar to Edge for undirected graphs, but a bit simpler.

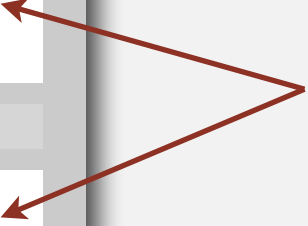

```
public class DirectedEdge
{
    private final int v, w;
    private final double weight;

    public DirectedEdge(int v, int w, double weight)
    {
        this.v = v;
        this.w = w;
        this.weight = weight;
    }

    public int from()
    { return v; }

    public int to()
    { return w; }

    public int weight()
    { return weight; }
}
```

from() and to() replace  
either() and other()

# Edge-weighted digraph API

---

```
public class EdgeWeightedDigraph
```

```
    EdgeWeightedDigraph(int V)    edge-weighted digraph with V vertices
```

```
    EdgeWeightedDigraph(In in)    edge-weighted digraph from input stream
```

```
    void addEdge(DirectedEdge e)    add weighted directed edge e
```

```
    Iterable<DirectedEdge> adj(int v)    edges pointing from v
```

```
    int V()    number of vertices
```

```
    int E()    number of edges
```

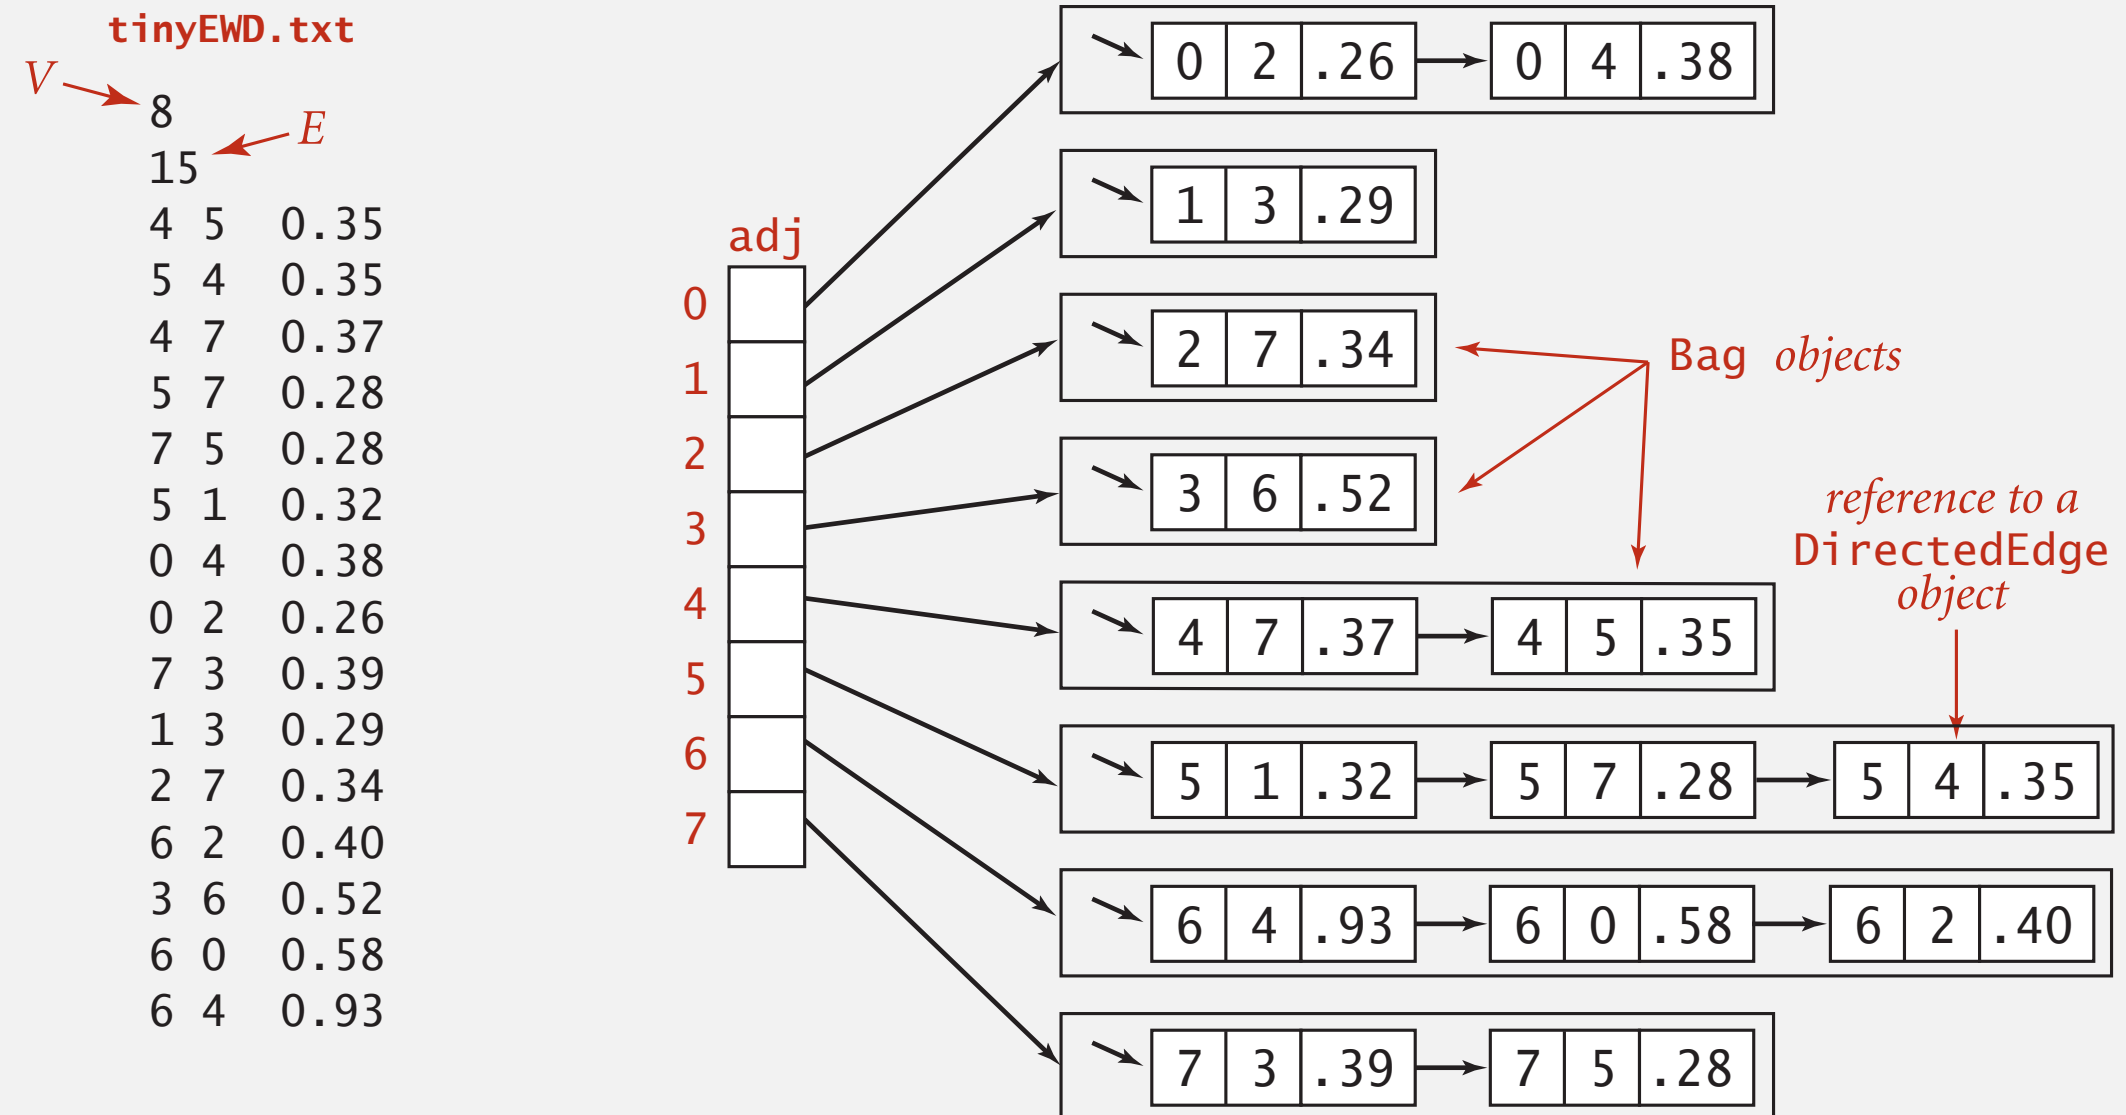

```
    Iterable<DirectedEdge> edges()    all edges
```

```
    String toString()    string representation
```

**Conventions.** Allow self-loops and parallel edges.

# Edge-weighted digraph: adjacency-lists representation

# Edge-weighted digraph: adjacency-lists implementation in Java

---

Same as EdgeWeightedGraph except replace Graph with Digraph.

```
public class EdgeWeightedDigraph
{
    private final int V;
    private final Bag<DirectedEdge>[] adj;

    public EdgeWeightedDigraph(int V)
    {
        this.V = V;
        adj = (Bag<DirectedEdge>[]) new Bag[V];
        for (int v = 0; v < V; v++)
            adj[v] = new Bag<DirectedEdge>();
    }

    public void addEdge(DirectedEdge e)
    {
        int v = e.from();
        adj[v].add(e);
    }

    public Iterable<DirectedEdge> adj(int v)
    {
        return adj[v];
    }
}
```

← add edge  $e = v \rightarrow w$  to  
only  $v$ 's adjacency list

# Single-source shortest paths API

---

**Goal.** Find the shortest path from  $s$  to every other vertex.

```
public class SP
```

```
    SP(EdgeWeightedDigraph G, int s)    shortest paths from s in graph G
```

```
    double distTo(int v)                length of shortest path from s to v
```

```
    Iterable <DirectedEdge> pathTo(int v)    shortest path from s to v
```

```
    boolean hasPathTo(int v)            is there a path from s to v?
```

```
SP sp = new SP(G, s);
for (int v = 0; v < G.V(); v++)
{
    StdOut.printf( s, v, sp.distTo(v));
    for (DirectedEdge e : sp.pathTo(v))
        StdOut.print(e + " ");
    StdOut.println();
}
```

# Single-source shortest paths API

---

**Goal.** Find the shortest path from  $s$  to every other vertex.

```
public class SP
```

```
    SP(EdgeWeightedDigraph G, int s)    shortest paths from s in graph G
```

```
    double distTo(int v)                length of shortest path from s to v
```

```
    Iterable <DirectedEdge> pathTo(int v)    shortest path from s to v
```

```
    boolean hasPathTo(int v)            is there a path from s to v?
```

```

# Data structures for single-source shortest paths

**Goal.** Find the shortest path from  $s$  to every other vertex.

**Observation.** A **shortest-paths tree** (SPT) solution exists. Why?

**Idea.** Represent the SPT with two vertex-indexed arrays:

- $\text{distTo}[v]$  is length of shortest path from  $s$  to  $v$ .
- $\text{edgeTo}[v]$  is last edge on shortest path from  $s$  to  $v$ .

shortest-paths tree from 0

|   | edgeTo[]  | distTo[] |                       |
|---|-----------|----------|-----------------------|
| 0 | null      | 0        |                       |
| 1 | 5->1 0.32 | 1.05     | 1.05 = 0.32+0.35+0.38 |
| 2 | 0->2 0.26 | 0.26     |                       |
| 3 | 7->3 0.37 | 0.97     |                       |
| 4 | 0->4 0.38 | 0.38     |                       |
| 5 | 4->5 0.35 | 0.73     |                       |
| 6 | 3->6 0.52 | 1.49     |                       |
| 7 | 2->7 0.34 | 0.60     |                       |

parent-link representation

# Data structures for single-source shortest paths

**Goal.** Find the shortest path from  $s$  to every other vertex.

**Observation.** A **shortest-paths tree** (SPT) solution exists. Why?

**Consequence.** Can represent the SPT with two vertex-indexed arrays:

- `distTo[v]` is length of shortest path from  $s$  to  $v$ .
- `edgeTo[v]` is last edge on shortest path from  $s$  to  $v$ .

```
public double distTo(int v)
{ return distTo[v]; }
```

```
public Iterable<DirectedEdge> pathTo(int v)
{
    Stack<DirectedEdge> path = new Stack<DirectedEdge>();
    for (DirectedEdge e = edgeTo[v]; e != null; e = edgeTo[e.from()])
        path.push(e);
    return path;
}
```

e.g., `pathTo(7)`

|   | edgeTo[]  | distTo[] |
|---|-----------|----------|
| 0 | null      | 0        |
| 1 | 5->1 0.32 | 1.05     |
| 2 | 0->2 0.26 | 0.26     |
| 3 | 7->3 0.37 | 0.97     |
| 4 | 0->4 0.38 | 0.38     |
| 5 | 4->5 0.35 | 0.73     |
| 6 | 3->6 0.52 | 1.49     |
| 7 | 2->7 0.34 | 0.60     |

# Edge relaxation

Relax edge  $e = v \rightarrow w$ .

- $\text{distTo}[v]$  is length of shortest **known** path from  $s$  to  $v$ .
- $\text{distTo}[w]$  is length of shortest **known** path from  $s$  to  $w$ .
- $\text{edgeTo}[w]$  is last edge on shortest **known** path from  $s$  to  $w$ .
- If  $e = v \rightarrow w$  gives shorter path to  $w$  through  $v$ , update both  $\text{distTo}[w]$  and  $\text{edgeTo}[w]$ .

$v \rightarrow w$  successfully relaxes

# Edge relaxation

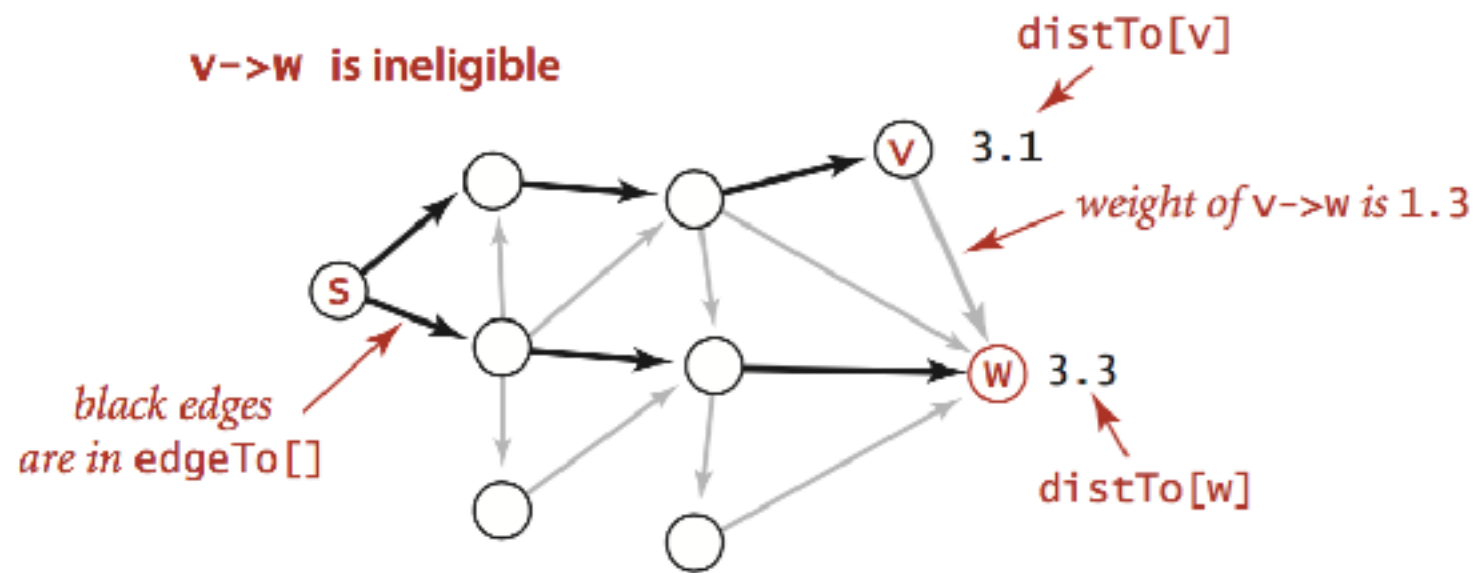

---

Relax edge  $e = v \rightarrow w$ .

- `distTo[v]` is length of shortest **known** path from  $s$  to  $v$ .
- `distTo[w]` is length of shortest **known** path from  $s$  to  $w$ .
- `edgeTo[w]` is last edge on shortest **known** path from  $s$  to  $w$ .
- If  $e = v \rightarrow w$  gives shorter path to  $w$  through  $v$ ,  
update both `distTo[w]` and `edgeTo[w]`.

```
private void relax(DirectedEdge e)
{
    int v = e.from(), w = e.to();
    if (distTo[w] > distTo[v] + e.weight())
    {
        distTo[w] = distTo[v] + e.weight();
        edgeTo[w] = e;
    }
}
```

# Edge relaxation

Edge relaxation (two cases)

# Dijkstra's algorithm: Java implementation

---

```
public class DijkstraSP
{
    private DirectedEdge[] edgeTo;
    private double[] distTo;
    private IndexMinPQ<Double> pq;

    public DijkstraSP(EdgeWeightedDigraph G, int s)
    {
        edgeTo = new DirectedEdge[G.V()];
        distTo = new double[G.V()];
        pq = new IndexMinPQ<Double>(G.V());

        for (int v = 0; v < G.V(); v++)
            distTo[v] = Double.POSITIVE_INFINITY;
        distTo[s] = 0.0;

        pq.insert(s, 0.0);
        while (!pq.isEmpty())
        {
            int v = pq.delMin();
            for (DirectedEdge e : G.adj(v))
                relax(e);
        }
    }
}
```

← relax vertices in order  
of distance from s

# Dijkstra's algorithm: Java implementation

---

```
private void relax(DirectedEdge e)
{
    int v = e.from(), w = e.to();
    if (distTo[w] > distTo[v] + e.weight())
    {
        distTo[w] = distTo[v] + e.weight();
        edgeTo[w] = e;
        if (pq.contains(w)) pq.decreaseKey(w, distTo[w]);
        else pq.insert(w, distTo[w]);
    }
}
```

← update PQ

# Dijkstra's algorithm: correctness proof

---

**Invariant.** For  $v$  in  $T$ ,  $\text{distTo}[v]$  is the length of the shortest path from  $s$  to  $v$ .

**Pf.**

- Let  $w$  be next vertex added to  $T$ .
- Let  $P^*$  be the  $s \rightarrow w$  path through  $v$ .
- Consider any other  $s \rightarrow w$  path  $P$ ; let  $x$  be first vertex to  $w$ .
- $P$  is already as long as  $P^*$  as soon as it reaches  $x$ .
- Thus,  $\text{distTo}[w]$  is the length of the shortest path from  $s$  to  $w$ .

# Dijkstra's algorithm: Performance Guarantee

---

Dijkstra's algorithm uses extra space proportional to  $V$  and time proportional to  $E \log V$  (in the worst case) to compute the SPT rooted at a given source in an edge-weighted digraph with  $E$  edges and  $V$  vertices.

```
public class DijkstraSP
{
    private DirectedEdge[] edgeTo;
    private double[] distTo;
    private IndexMinPQ<Double> pq;

    public DijkstraSP(EdgeWeightedDigraph G, int s)
    {
        edgeTo = new DirectedEdge[G.V()];
        distTo = new double[G.V()];
        pq = new IndexMinPQ<Double>(G.V());

        for (int v = 0; v < G.V(); v++)
            distTo[v] = Double.POSITIVE_INFINITY;
        distTo[s] = 0.0;

        pq.insert(s, 0.0);
        while (!pq.isEmpty())
        {
            int v = pq.delMin();
            for (DirectedEdge e : G.adj(v))
                relax(e);
        }
    }
}
```

# Computing a spanning tree in a graph

---

Dijkstra's algorithm seem familiar?

- Prim's algorithm is essentially the same algorithm.
- Both are in a family of algorithms that compute a spanning tree.

**Main distinction:** Rule used to choose next vertex for the tree.

- Prim: Closest vertex to the **tree** (via an undirected edge).
- Dijkstra: Closest vertex to the **source** (via a directed path).

# Shortest path variants

---

- Single source: from one vertex  $s$  to every other vertex.
- Source-Sink: from one vertex  $s$  to another  $t$ .
  - use Dijkstra's algorithm, but terminate the search as soon as  $t$  comes off the priority queue.
- All pairs: between all pairs of vertices.

```
public class DijkstraAllPairsSP
{
    private DijkstraSP[] all;

    DijkstraAllPairsSP(EdgeWeightedDigraph G)
    {
        all = new DijkstraSP[G.V()]
        for (int v = 0; v < G.V(); v++)
            all[v] = new DijkstraSP(G, v);
    }

    Iterable<Edge> path(int s, int t)
    { return all[s].pathTo(t); }

    double dist(int s, int t)
    { return all[s].distTo(t); }
}
```

# Shortest paths in edge-weighted DAGs

---

**Proposition.** Topological sort algorithm computes SPT in any edge-weighted DAG in time proportional to  $E + V$ .

edge weights  
can be negative!

**Pf.**

- Each edge  $e = v \rightarrow w$  is relaxed exactly once (when vertex  $v$  is relaxed), leaving  $\text{distTo}[w] \leq \text{distTo}[v] + e.\text{weight}()$ .
- Inequality holds until algorithm terminates because:
- $\text{distTo}[w]$  cannot increase   $\text{distTo}[]$  values are monotone decreasing
- $\text{distTo}[v]$  will not change  because of topological order, no edge pointing to  $v$  will be relaxed after  $v$  is relaxed
- Thus, upon termination, shortest-paths optimality conditions hold. ■

# Shortest paths in edge-weighted DAGs

---

```
public class AcyclicSP
{
    private DirectedEdge[] edgeTo;
    private double[] distTo;

    public AcyclicSP(EdgeWeightedDigraph G, int s)
    {
        edgeTo = new DirectedEdge[G.V()];
        distTo = new double[G.V()];

        for (int v = 0; v < G.V(); v++)
            distTo[v] = Double.POSITIVE_INFINITY;
        distTo[s] = 0.0;

        Topological topological = new Topological(G);
        for (int v : topological.order())
            for (DirectedEdge e : G.adj(v))
                relax(e);
    }
}
```

← topological order

# Longest paths in edge-weighted DAGs

Formulate as a shortest paths problem in edge-weighted DAGs.

- Negate all weights.
- Find shortest paths.
- Negate weights in result.

equivalent: reverse sense of equality in relax()

longest paths input

5→4 0.35  
4→7 0.37  
5→7 0.28

1→3 -0.29  
7→2 -0.34  
6→2 -0.40  
3→6 -0.52  
6→0 -0.58  
6→4 -0.93

**Key point.** Topological sort algorithm works even with negative weights.

# Longest paths in edge-weighted DAGs: application

**Parallel job scheduling.** Given a set of jobs with durations and precedence constraints, schedule the jobs (by finding a start time for each) so as to achieve the minimum completion time, while respecting the constraints.

| <i>job</i> | <i>duration</i> | <i>must complete before</i> |   |   |
|------------|-----------------|-----------------------------|---|---|
| 0          | 41.0            | 1                           | 7 | 9 |
| 1          | 51.0            | 2                           |   |   |
| 2          | 50.0            |                             |   |   |
| 3          | 36.0            |                             |   |   |
| 4          | 38.0            |                             |   |   |
| 5          | 45.0            |                             |   |   |

| 7          | 32.0            | 3                           | 8 |   |
| 8          | 32.0            | 2                           |   |   |
| 9          | 29.0            | 4                           | 6 |   |

Parallel job scheduling solution

# Critical path method

**CPM.** To solve a parallel job-scheduling problem, create edge-weighted DAG:

- Source and sink vertices.
- Two vertices (begin and end) for each job.
- Three edges for each job.
- begin to end (weighted by duration)
- source to begin (0 weight)
- end to sink (0 weight)
- One edge for each precedence constraint (0 weight).

| job | duration | must complete before |   |   |
|-----|----------|----------------------|---|---|
| 0   | 41.0     | 1                    | 7 | 9 |
| 1   | 51.0     | 2                    |   |   |
| 2   | 50.0     |                      |   |   |
| 3   | 36.0     |                      |   |   |
| 4   | 38.0     |                      |   |   |
| 5   | 45.0     |                      |   |   |
| 6   | 21.0     | 3                    | 8 |   |
| 7   | 32.0     | 3                    | 8 |   |
| 8   | 32.0     | 2                    |   |   |
| 9   | 29.0     | 4                    | 6 |   |

# Critical path method

CPM. Use **longest path** from the source to schedule each job.

Parallel job scheduling solution
