- ▶ *Prim's algorithm*
- ▶ *context*

Edge-Weighted Graph

Weighted edge API

Edge abstraction needed for weighted edges.

```
public class Edge implements Comparable<Edge>
```

```
    Edge(int v, int w, double weight)    create a weighted edge v-w
```

```
    int          either()                either endpoint
```

```
    int          other(int v)            the endpoint that's not v
```

```
    int          compareTo(Edge that)    compare this edge to that edge
```

```
    double       weight()                the weight
```

```
    String       toString()              string representation
```

Idiom for processing an edge `e`: `int v = e.either(), w = e.other(v);`

Weighted edge: Java implementation

```
public class Edge implements Comparable<Edge>
{
    private final int v, w;
    private final double weight;
```

```
    public Edge(int v, int w, double weight)
    {
        this.v = v;
        this.w = w;
        this.weight = weight;
    }
```

← constructor

```
    public int either()
    { return v; }
```

← either endpoint

```
    public int other(int vertex)
    {
        if (vertex == v) return w;
        else return v;
    }
```

← other endpoint

```
    public int compareTo(Edge that)
    {
        if (this.weight < that.weight) return -1;
        else if (this.weight > that.weight) return +1;
        else return 0;
    }
}
```

← compare edges by weight

Edge-weighted graph API

```
public class EdgeWeightedGraph
```

```
EdgeWeightedGraph(int V)
```

create an empty graph with V vertices

```
EdgeWeightedGraph(In in)
```

create a graph from input stream

```
void
```

```
addEdge(Edge e)
```

add weighted edge e to this graph

```
Iterable<Edge>
```

```
adj(int v)
```

edges incident to v

```
Iterable<Edge>
```

```
edges()
```

all edges in this graph

```
int
```

```
V()
```

number of vertices

```
int
```

```
E()
```

number of edges

```
String
```

```
toString()
```

string representation

Edge-weighted graph: adjacency-lists representation

Maintain vertex-indexed array of Edge lists.

Edge-weighted graph: adjacency-lists implementation

```
public class EdgeWeightedGraph
{
    private final int V;
    private final Bag<Edge>[] adj;
```

```
    public EdgeWeightedGraph(int V)
    {
        this.V = V;
        adj = (Bag<Edge>[]) new Bag[V];
        for (int v = 0; v < V; v++)
            adj[v] = new Bag<Edge>();
    }
```

← same as Graph, but adjacency lists of Edges instead of integers

← constructor

```
    public void addEdge(Edge e)
    {
        int v = e.either(), w = e.other(v);
        adj[v].add(e);
        adj[w].add(e);
    }
```

← add edge to both adjacency lists

```
    public Iterable<Edge> adj(int v)
    { return adj[v]; }
```

```
}
```

Minimum spanning tree

Def. A **spanning tree** of G is a subgraph T that is:

- Connected.
- Acyclic.
- Includes all of the vertices.

graph G

Minimum spanning tree

Def. A **spanning tree** of G is a subgraph T that is:

- Connected.
- Acyclic.
- Includes all of the vertices.

not connected

Minimum spanning tree

Def. A **spanning tree** of G is a subgraph T that is:

- Connected.
- Acyclic.
- Includes all of the vertices.

not acyclic

Minimum spanning tree

Def. A **spanning tree** of G is a subgraph T that is:

- Connected.
- Acyclic.
- Includes all of the vertices.

not spanning

Minimum spanning tree problem

Input. Connected, undirected graph G with positive edge weights.

edge-weighted graph G

Minimum spanning tree problem

Input. Connected, undirected graph G with positive edge weights.

Output. A min weight spanning tree.

minimum spanning tree T
(weight = 50 = 4 + 6 + 8 + 5 + 11 + 9 + 7)

Brute force. Try all spanning trees?

Minimum spanning tree API

Q. How to represent the MST?

| public class MST | | |
|-------------------------|--------------------------|----------------------|
| | MST(EdgeWeightedGraph G) | <i>constructor</i> |
| Iterable<Edge> | edges() | <i>edges in MST</i> |
| double | weight() | <i>weight of MST</i> |

tinyEWG.txt

```
% java MST tinyEWG.txt  
0-7 0.16  
1-7 0.19  
0-2 0.26  
2-3 0.17  
5-7 0.28  
4-5 0.35  
6-2 0.40  
1.81
```

Minimum spanning tree API

Q. How to represent the MST?

| public class MST | | |
|-------------------------|--------------------------|----------------------|
| | MST(EdgeWeightedGraph G) | <i>constructor</i> |
| Iterable<Edge> | edges() | <i>edges in MST</i> |
| double | weight() | <i>weight of MST</i> |

```
public static void main(String[] args)
{
    In in = new In(args[0]);
    EdgeWeightedGraph G = new EdgeWeightedGraph(in);
    MST mst = new MST(G);
    for (Edge e : mst.edges())
        StdOut.println(e);
    StdOut.printf("%.2f\n", mst.weight());
}
```

```

Kruskal's algorithm: visualization

Kruskal's algorithm: correctness proof

Proposition. [Kruskal 1956] Kruskal's algorithm computes the MST.

Pf. Kruskal's algorithm is a special case of the greedy MST algorithm.

- Suppose Kruskal's algorithm colors the edge $e = v-w$ black.
- Cut = set of vertices connected to v in tree T .
- No crossing edge is black (by the algorithm).
- No crossing edge has lower weight. Why?

Kruskal's algorithm: implementation challenge

Challenge. Would adding edge $v-w$ to tree T create a cycle? If not, add it.

How difficult?

- $E + V$
- V ←
- $\log V$
- $\log^* V$ ← use the union-find data structure !
- 1

run DFS from v , check if w is reachable
(T has at most $V - 1$ edges)

Kruskal's algorithm: implementation challenge

Challenge. Would adding edge $v-w$ to tree T create a cycle? If not, add it.

Efficient solution. Use the **union-find** data structure.

- Maintain a set for each connected component in T .
- If v and w are in same set, then adding $v-w$ would create a cycle.
- To add $v-w$ to T , merge sets containing v and w .

Case 1: adding $v-w$ creates a cycle

Case 2: add $v-w$ to T and merge sets containing v and w

Kruskal's algorithm: Java implementation

ElogE

```
public class KruskalMST
{
    private Queue<Edge> mst = new Queue<Edge>();

    public KruskalMST(EdgeWeightedGraph G)
    {
        MinPQ<Edge> pq = new MinPQ<Edge>(G.edges());

        UF uf = new UF(G.V());
        while (!pq.isEmpty() && mst.size() < G.V()-1)
        {
            Edge e = pq.delMin();
            int v = e.either(), w = e.other(v);
            if (!uf.connected(v, w))
            {
                uf.union(v, w);
                mst.enqueue(e);
            }
        }
    }

    public Iterable<Edge> edges()
    { return mst; }
}
```

← build priority queue
(or sort)

← greedily add edges to MST

← edge v-w does not create cycle

← merge sets

← add edge to MST

Kruskal's algorithm: running time

Proposition. Kruskal's algorithm computes MST in time proportional to $E \log E$ (in the worst case).

Pf.

| operation | frequency | time per op |
|-------------------|-----------|--------------------|
| build pq | 1 | E |
| delete-min | E | $\log E$ |
| union | V | $\log^* V^\dagger$ |
| connected | E | $\log^* V^\dagger$ |

\dagger amortized bound using weighted quick union with path compression

Prim's algorithm: implementation challenge

Challenge. Find the min weight edge with exactly one endpoint in T .

How difficult?

- E ← try all edges
- $E \log E$
- $\log E$ ← use a priority queue!
- $\log^* E$
- 1

Prim's algorithm: lazy implementation

Challenge. Find the min weight edge with exactly one endpoint in T .

Lazy solution. Maintain a PQ of **edges** with (at least) one endpoint in T .

- Key = edge; priority = weight of edge.
- Delete-min to determine next edge $e = v-w$ to add to T .
- Disregard if both endpoints v and w are marked (both in T).
- Otherwise, let w be the unmarked vertex (not in T):
 - add to PQ any edge incident to w (assuming other endpoint not in T)
 - add e to T and mark w

Prim's algorithm: lazy implementation

```
public class LazyPrimMST
{
    private boolean[] marked;    // MST vertices
    private Queue<Edge> mst;     // MST edges
    private MinPQ<Edge> pq;     // PQ of edges

    public LazyPrimMST(WeightedGraph G)
    {
        pq = new MinPQ<Edge>();
        mst = new Queue<Edge>();
        marked = new boolean[G.V()];
        visit(G, 0);

        while (!pq.isEmpty() && mst.size() < G.V() - 1)
        {
            Edge e = pq.delMin();
            int v = e.either(), w = e.other(v);
            if (marked[v] && marked[w]) continue;
            mst.enqueue(e);
            if (!marked[v]) visit(G, v);
            if (!marked[w]) visit(G, w);
        }
    }
}
```

← assume G is connected

← repeatedly delete the
min weight edge $e = v-w$ from PQ

← ignore if both endpoints in T

← add edge e to tree

← add v or w to tree

Prim's algorithm: lazy implementation demo

加入heap 概念，改進先前每次新的點進入都需要排序

edges on PQ
(sorted by weight)

3-6 0.52

6-0 0.58

6-4 0.93

Prim's algorithm: lazy implementation demo

- Start with vertex 0 and greedily grow tree T .
- Add to T the min weight edge with exactly one endpoint in T .
- Repeat until $V - 1$ edges.

MST edges

0-7 1-7 0-2 2-3 5-7 4-5 6-2

Prim's algorithm: lazy implementation

```
public class LazyPrimMST
{
    private boolean[] marked;    // MST vertices
    private Queue<Edge> mst;     // MST edges
    private MinPQ<Edge> pq;     // PQ of edges
```

```
    public LazyPrimMST(WeightedGraph G)
    {
```

```
        pq = new MinPQ<Edge>();
        mst = new Queue<Edge>();
        marked = new boolean[G.V()];
        visit(G, 0);
```

```
        while (!pq.isEmpty() && mst.size() < G.V() - 1)
        {
```

```
            Edge e = pq.delMin();
            int v = e.either(), w = e.other(v);
            if (marked[v] && marked[w]) continue;
            mst.enqueue(e);
            if (!marked[v]) visit(G, v);
            if (!marked[w]) visit(G, w);
        }
```

```
    }
```

```
}
```

← assume G is connected

← repeatedly delete the
min weight edge $e = v-w$ from PQ

← ignore if both endpoints in T

← add edge e to tree

← add v or w to tree

Prim's algorithm: lazy implementation

```
private void visit(WeightedGraph G, int v)
{
    marked[v] = true;
    for (Edge e : G.adj(v))
        if (!marked[e.other(v)])
            pq.insert(e);
}
```

```
public Iterable<Edge> mst()
{ return mst; }
```

← add v to T

← for each edge $e = v-w$, add to PQ if w not already in T

Prim's algorithm: visualization

Lazy Prim's algorithm: running time

Proposition. Lazy Prim's algorithm computes the MST in time proportional to $E \log E$ and extra space proportional to E (in the worst case).

Pf.

| operation | frequency | binary heap |
|-------------------|-----------|-------------|
| delete min | E | $\log E$ |
| insert | E | $\log E$ |

Prim's algorithm: eager implementation

Challenge. Find min weight edge with exactly one endpoint in T .

Observation. For each vertex v , need only **shortest** edge connecting v to T .

- MST includes at most one edge connecting v to T . Why?

Prim's algorithm: eager implementation demo

多做一次檢查，再加入 heap 時，判斷是否先前已有線連到此點，如果沒有比較小就不加入

- Start with vertex 0 and greedily grow tree T .
- Add to T the min weight edge with exactly one endpoint in T .
- Repeat until $V - 1$ edges.

Prim's algorithm: eager implementation

Challenge. Find min weight edge with exactly one endpoint in T .

↙ pq has at most one entry per vertex

Eager solution. Maintain a PQ of **vertices** connected by an edge to T , where priority of vertex v = weight of shortest edge connecting v to T .

- Delete min vertex v and add its associated edge $e = v-w$ to T .
- Update PQ by considering all edges $e = v-x$ incident to v
 - ignore if x is already in T
 - add x to PQ if not already on it
 - **decrease priority** of x if $v-x$ becomes shortest edge connecting x to T

    public double weight()          // See Exercise 4.3.31.
}
```

Eager Version's Prim's algorithm

The eager version of Prim's algorithm uses extra space proportional to V and time proportional to $E \log V$ (in the worst case) to compute the MST of a connected edge-weighted graph with E edges and V vertices.

| | | |
|-------------------|-----|------------|
| <i>lazy Prim</i> | E | $E \log E$ |
| <i>eager Prim</i> | V | $E \log V$ |
| <i>Kruskal</i> | E | $E \log E$ |
